Broadcast Receivers

Content Providers

Keywords

- ▶ *xml* file
- ▶ In the root of the app directory
- ▶ Describes application components and resources
 - ▶ Application name and Java package (unique)
 - ▶ Activities, Services, Broadcast Receivers, ContentProviders
 - ▶ Start activity
 - ▶ Permissions
 - ▶ Libraries
 - ▶ Minimum API level

- ▶ Determine what resources and APIs an application can access
- ▶ Meant to provide security through sandboxing
- ▶ Declared in the Manifest
 - ▶ `<uses-permission android:name="android.permission.RECEIVE_SMS" />`
- ▶ Permission is asked at install time: all or nothing
- ▶ Can not be granted afterwards
- ▶ Control who can access your components and resources
 - ▶ Start activity, start or bind service, send broadcasts, access data in Content Provider
 - ▶ URI permissions

- ▶ *res/* directory
- ▶ Each resource type in a different subdirectory with specific name
 - ▶ *drawable/*, *layout/*, *values/*, *menu/*, *xml/*, etc.
 - ▶ The default resources
- ▶ For different configurations we may need different resources
 - ▶ Bigger screen -> different layout
 - ▶ Different language -> different strings
 - ▶ Subdirectory for each alternative set of resources
 - ▶ `<resources_name>-<config_qualifier>`
 - ▶ *drawable-hdpi/* for High Density Screens
 - ▶ Resource chosen at runtime based on the configuration
- ▶ An ID is generated for each resource name in *gen/*

- ▶ Resources from *res/layouts/*
- ▶ Describe the UI of an activity or part of the UI
- ▶ *res/layout/filename.xml*
 - ▶ filename is used as resource ID
- ▶ UI elements
- ▶ Can be edited as an xml or using the tools provided
- ▶ Easy to learn, hard to master

- ▶ Resources from *res/drawables/*
- ▶ Element that can be drawn on the screen
- ▶ Can be images (.png, .jpg, or .gif) or xmls
- ▶ xmls describe how an UI element reacts to input (pressed, focused)
- ▶ xmls point to images
- ▶ Visual feedback for interaction

Applications

Activities

Services

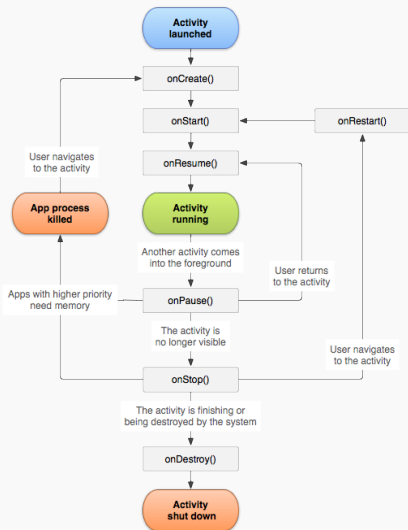

Intents

Broadcast Receivers

Content Providers

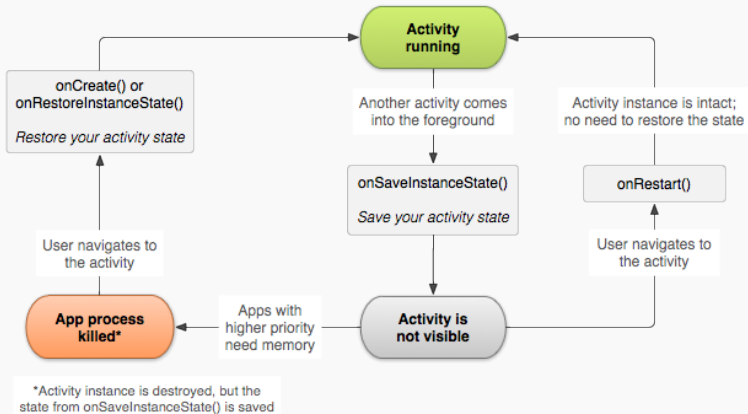

Keywords

- ▶ Application component
- ▶ User interface window, provide user interaction
- ▶ Require a layout
- ▶ Can only draw and change UI from the Looper thread
 - ▶ Computationally intensive or wait based tasks on separate threads
- ▶ An application may include multiple activities
 - ▶ Only one is the main activity
 - ▶ Activities can start each other -> the previous one is stopped
 - ▶ Activity stack ("back stack")
 - ▶ Back -> activity destroyed and previous one resumed

Source: <http://developer.android.com>

- ▶ Activities can be killed after *onPause()*, *onStop()* in low memory situations
 - ▶ The activity state (objects) are lost
 - ▶ Can preserve state by saving objects
 - ▶ User interaction can be saved and restored
 - ▶ Callback *onSaveInstanceState()*
 - ▶ Save information in a Bundle
 - ▶ *onCreate()*, *onRestoreInstanceState()*
 - ▶ Restore the activity state
 - ▶ Threads can be stopped gracefully
 - ▶ In *onPause()* threads should be signaled to stop

Source: <http://developer.android.com>

- ▶ UI is a hierarchy of views
- ▶ *View*: rectangular space, provides user interaction
- ▶ Buttons, Lists, Fragments, Images, Text Boxes
- ▶ Callbacks for actions
- ▶ A *ViewGroup* includes other *View* or *ViewGroup* objects
- ▶ Classes can be extended to provide more complex views
- ▶ Adapters allow for more complex data types to displayed

Applications

Activities

Services

Intents

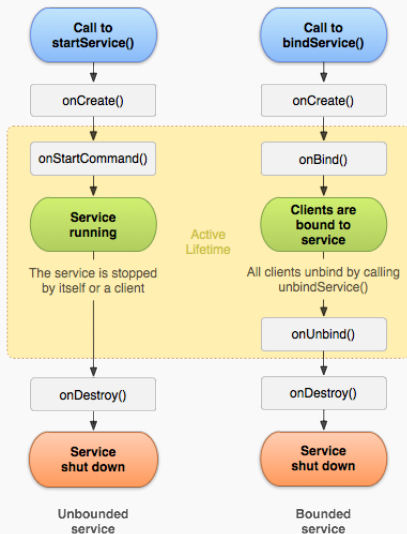

Broadcast Receivers

Content Providers

Keywords

- ▶ Performs operations in the background
- ▶ Does not provide a UI
- ▶ Continues to run even if another application is in foreground
- ▶ Is able to perform network transactions, file I/O operations, interact with content providers, etc.
- ▶ A service runs in the main thread of the hosting process
 - ▶ A separate thread should be created if the service performs CPU intensive or blocking operations
- ▶ Can be started by any application using an Intent
 - ▶ Block access from other apps by declaring the service as private in the manifest

- ▶ Started
 - ▶ An application component calls *startService()*
 - ▶ Performs a single operation, then stops itself and does not return a result to the caller
 - ▶ Runs even if the caller component is destroyed
- ▶ Bound
 - ▶ An application component binds to it by calling *bindService()*
 - ▶ Provides a client-server interface - send requests, return results
 - ▶ Runs as long as the application component is bound to it
 - ▶ Multiple components can bind to a service at once
 - ▶ Service destroyed after all components unbind

Applications

Activities

Services

Intents

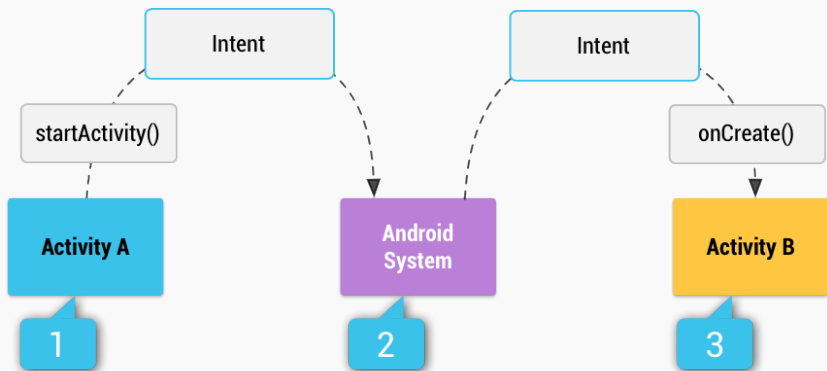

Broadcast Receivers

Content Providers

Keywords

- ▶ An object used for delivering a message
- ▶ Used for
 - ▶ Starting an activity
 - ▶ Starting or binding a service
 - ▶ Delivering a broadcast message
- ▶ Includes component name, action and data
- ▶ Intent filters
 - ▶ Declare the types of intents that a component can receive
 - ▶ Specified in the manifest - `<intent-filter>`
 - ▶ `<action>`, `<data>`

- ▶ Two types of intents
 - ▶ Explicit intents
 - ▶ Specify exactly which component to start (the class name)
 - ▶ Typically used to start components in your own app
 - ▶ Will be delivered even if there is no intent filter declared
 - ▶ Implicit intents
 - ▶ Do not specify the exact component
 - ▶ Declare a general action to be performed
 - ▶ The Android system finds the appropriate component
 - ▶ Compares the intent to the intent filters in the manifest of the apps

Applications

Activities

Services

Intents

Broadcast Receivers

Content Providers

Keywords

- ▶ Responds to system-wide broadcast announcements
- ▶ The system generates many broadcasts
 - ▶ Example: battery is low, screen has turned off, etc.
- ▶ Apps can generate broadcasts - send an announcement for other apps
- ▶ No UI, may create a notification in the status bar to alert the user
- ▶ The receiver lets other components perform the work based on the event

- ▶ Each broadcast is delivered as an *Intent*
 - ▶ Intent passed to *startBroadcast()* or *startOrderedBroadcast()*
- ▶ Local broadcasts using *LocalBroadcastManager*
 - ▶ More efficient
 - ▶ Data does not leave the app
 - ▶ Other apps cannot send the broadcast - no security holes
- ▶ Register a receiver in two ways
 - ▶ Statically in the manifest using the `<receiver>` tag
 - ▶ Dynamically using *Context.registerReceiver()*

- ▶ Two types of broadcasts
 - ▶ Normal broadcasts
 - ▶ Completely Asynchronous
 - ▶ All receivers run in an undefined order
 - ▶ Ordered broadcasts
 - ▶ Delivered to one receiver at a time
 - ▶ Each receiver executes and may propagate the result to the next or abort the broadcast
 - ▶ The order is determined using the *android:priority* in the `<intent-filter>` of the receiver

Applications

Activities

Services

Intents

Broadcast Receivers

Content Providers

Keywords

- ▶ Provide access to a repository of data
- ▶ To access a provider you have to request specific permissions (in the manifest)
 - ▶ `<uses-permission android:name="android.permission.READ_USER_DICTIONARY">`
- ▶ Two ways of storing data
 - ▶ File data - audio, video, photos
 - ▶ Structured data - database, array, etc.
 - ▶ Form compatible with tables of rows and columns
 - ▶ Usually a SQLite database

- ▶ Interface for accessing data in one process from another process
 - ▶ Provider and provider client
 - ▶ The application that owns the data includes the provider
 - ▶ The client application owns the provider client
- ▶ Access data using a *ContentResolver* client object
 - ▶ Its methods provide CRUD (create, retrieve, update, delete) functions
 - ▶ Calls the methods with the same name in the *ContentProvider* object

- ▶ Identify data in the provider
- ▶ Include a symbolic name for the provider (*authority*) and a name for the table (*path*)
 - ▶ Example: `content://user_dictionary/words`
 - ▶ The *ContentResolver* uses the *authority* for identifying the provider
 - ▶ From a system table with all known providers
 - ▶ The *ContentResolver* sends a query to the provider
 - ▶ The *ContentProvider* uses the *path* to identify the table

Applications

Activities

Services

Intents

Broadcast Receivers

Content Providers

Keywords

- ▶ Manifest file
- ▶ Permissions
- ▶ Resources
- ▶ Layouts
- ▶ Drawables
- ▶ Activity
- ▶ Service
- ▶ Intent
- ▶ Broadcast Receiver
- ▶ Content Provider
- ▶ Content URI
